TITLE: Setup for measuring low-activity preparations according to hard beta-radiation, halogen counter, STS-5

CITED SOURCE: Izv. ¹⁹Timiryazevsk. s.-kh. akad., no. 5, 1962, 195-202

TOPIC TAGS: low-activity radiation measurement, hard beta-ray emission, radiation measurement

TRANSLATION: A setup is described for the measurement of radioactive preparations with weak emission according to the hard β -radiation. The radiation detector is an STS-5 halogen counter (length of plateau 200 volts, slope -- 2.1% per 100 volts). The counters (working counter and 18 protective counters) are enclosed in a horizontal lead housing of the MIZ type with a wall thickness of up to 50 mm. The setup uses an anticoincidence circuit with three GNP tubes enclosed in the BGS block and powered from a stabilized source mounted in the

Card 1/2

L 19347-63

ACCESSION NR: AR3005190

PS-64 block of the B-type apparatus. The circuit is easily adjustable and reliable in operation. A table is included which compares the minimum activity levels with the B-type setup with and without the anticoincidence circuit. The setup makes it possible to measure $Sr^{90} + Y^{90}$ preparations with an activity of $A = 1 \cdot 10^{-12}$ curie with an accuracy of $\delta = 40\%$ over a time $t = 2$ hours.

AUTHOR: Ivanov, V.V.; Furman, A.V.

ORG: ^{44, 55}Electrotechnical Institute, Novosibirsk (Elektrotekhnicheskiy institut)

TITLE: An approximate solution of the problem of nonlinear heat conductivity

SOURCE: Inzhenerno-fizicheskiy zhurnal, v.9, no.5, 1965, 594-596

TOPIC TAGS: ^{21, 44, 55}heat conductivity, heat transfer, heat capacity, non-linear differential equation ^{76, 44, 55}

ABSTRACT: The article considers unsteady state heat transfer in solid bodies when the thermophysical properties are functions of the temperature. The problem reduces to the solution of the nonlinear differential equation of heat conductivity

$$\rho(T)C(T) \frac{\partial T}{\partial \tau} = \text{div}[\lambda(T) \text{grad } T] \quad (1)$$

with appropriate initial and boundary conditions. For most materials the density is a constant, but the relationships between the coefficients of heat conductivity and heat capacity and the temperature are

Card 1/3

UDC: 536.21

I. 8988-66

ACC NR: AP5027572

nonlinear functions:

$$\lambda(T) = \lambda_0 + nT, \quad (2)$$

$$C(T) = C_0 + mT. \quad (3)$$

In a given interval or, if this interval is sufficiently large, in sections of it, relationships (2) and (3) can be replaced by exponential functions:

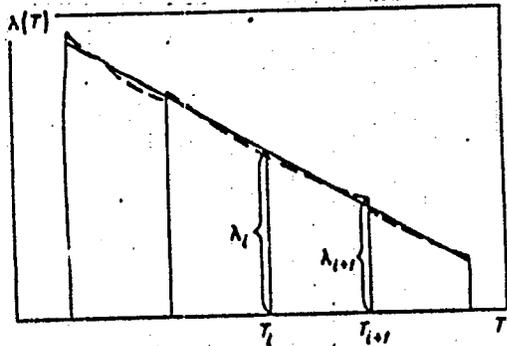

$$\lambda(T) = \lambda_0 + nT = \lambda_i \exp\left(\frac{T - T_i}{T_{i+1} - T_i} \ln \frac{\lambda_{i+1}}{\lambda_i}\right), \quad (4)$$

$$C(T) = C_0 + mT = C_i \exp\left(\frac{T - T_i}{T_{i+1} - T_i} \ln \frac{C_{i+1}}{C_i}\right). \quad (5)$$

Here λ_1, λ_{1+1} and C_1, C_{1+1} are the approximate values of the heat conductivity and heat capacity coefficients at the limits of a chosen temperature interval $\Delta T = T_{1+1} - T_1$ (See Figure).

TITLE: Investigation of ²heating of solids by convective and radiant fluxes

SOURCE: AN SSSR. Izvestiya. Energetika i transport, no. 1, 1966, 131-134

TOPIC TAGS: dimension analysis, radiative heat transfer, convective heat transfer, heat theory

ABSTRACT: A simple approximate method is proposed for calculating the ²temperature field in bodies heated by simultaneous convection and radiation where the physical properties of the body (thermal conductivity and specific heat) vary together with temperature. A partial differential equation is given in dimensionless form for specific heat as a function of temperature in terms of the temperature dependence of thermal conductivity and the boundary conditions for this problem are formulated. A procedure for simplification and approximate solution of this system of equations is given. Numerical calculations assuming constant thermophysical parameters showed that when the

Stark number $Sk = \frac{\sigma_0 T_0^3}{\lambda_0} R$ is small and the dimensionless temperature θ_0 is high, it may be assumed that

$$\frac{n}{N} p = 4 \left(\frac{\theta_0 + 1}{2} \right)^2 + \frac{Bi}{Sk}$$

Card 1/2

UDC: 536.12:536.25:536.3

L 05099-67

ACC NR: AP6008134

where $Bi = aR/\lambda_0$ is the Biot number and p is a positive real number. For low θ_0 and large Sk , the region for the variation in θ should be divided into k intervals: $0, -\theta_1, \dots, \theta_{k-1} - \theta_0, \dots, \theta_{k-1} - 1$ and p should be chosen for each interval from the relationships

$$\frac{n}{N} p_k = 4\theta_k^2 + \frac{Bi}{Sk}, \quad \frac{n}{N} p_k = 4 \left(\frac{\theta_{k-1} + 1}{2} \right)^2 + \frac{Bi}{Sk}.$$

The error in calculation of the temperature field for all generalized dimensionless coordinates $X=x/R$ is less than 5% with proper selection of the parameter p . A table is given comparing temperatures in an infinite plate calculated by various methods. Orig. art. has: 1 table, 19 formulas.

Title : The Philosophical Seminars in the Soil-Biology Faculty
of the Moscow State University

Orig Pub: Vopr. filosofii, 1957, No 3, 215-216

Abstract: In 1949 philosophical seminars of the professors
and teachers of the Soil-Biology Faculty of the Mos-
cow State University began to work. Actual philo-
sophical questions of biology were discussed at them:
species and species formation; on the laws of develop-
ment of the organic world, the problem of the complete-
ness of an organism, and others.

TITLE: Wave processes in hydraulic couplings of hydraulic transmissions

SOURCE: Mashinovedeniye, no. 6, 1966, 66-72

TOPIC TAGS: vibration propagation, sound propagation, vibration transmission, fluid flow, flow analysis, *HYDRAULIC ENGINEERING*

ABSTRACT: The propagation of a sound wave in a hydraulic pressure line consisting of a system of two pipes and two vessels filled with an elastic fluid is investigated, and the influence of the vessels on the propagation mechanism of the sound wave is determined. From a fluid's differential equations of motion and continuity, considering its initial and sectional boundary conditions, and applying Fourier and graphic computation methods, an equation is derived which permits the pressure and the flow velocity at any point in the system to be determined. As demonstrated by a numerical example, a sudden inflow-pressure change effects in the next vessel a harmonic pressure change of an amplitude equal to the pressure jump and of a lag equal to the pressure wave's propagation time to the vessel. The pressure fluctuation frequency is influenced by the presence of the second vessel, and the natural fluctua-

Ed.: E. S. Glushko, Doctor of Technical Sciences; Knes. Ed.: E. I. Stepanovskiy; Tech. Ed.: A. S. Polonin.

PURPOSE: This collection of articles is intended for specialists engaged in designing and operating gas units of industrial enterprises and electric power plants.

CONTENTS: The change-over in some industrial enterprises from solid and liquid fuels to natural gas is discussed and further possibilities existing along this line are examined. Advantages of using natural gas as a source of energy are outlined. Different gas burner systems. Devices for automatic control of the combustion process, structural features of furnaces operating on natural

gas, gas-supply systems and the introduction of safety measures in the construction and operation of gas units are described. The book contains many diagrams of gas-supply systems and equipment. No personalities are mentioned. Our article is followed by references.

Title : Universal Radioactive Density Meter for Liquids

Orig Pub : Priborostroyeniye, 1956, No 7, 25-27

Abstract : The universal radioactive density meter for liquids (PZkR) which was developed by NIITeplopribor, is based on the phenomenon of absorption of a direct beam of gamma radiation on passage by the latter through a layer of liquid, and is a general purpose, industrial, noncontact instrument for remote control, continuous, determination, recording and regulation of density of any liquid. Instrumental error, for any measurement range, does not exceed ± 0.01 g/cm³. The instrument embodies a compensation

Card 1/3

Control and Measuring Devices. Automatic Regulation.

Abs Jour : Ref Zhur - Khimiya, No 2, 1957, 6983

system. The comparison channel has its own radioactive source, metal compensation wedge, radiation receiver and a separate forming unit. Difference signal of the 3 measurement channels is transmitted to a servomotor which moves the compensation wedge. Since the intensity of gamma radiation, that has passed through matter, is proportional to density of matter, displacement of the wedge constitute the measure of change in density of the liquid. The wedge is connected to the pointer of the indicator instrument. When the servomotor moves the wedge it also moves the core of the induction coil which is the reference input element of the telemetering system of the secondary instrument. The electronic unit designed as an indicator panel instrument can be located up to 200 m from the radioactive data unit. The secondary instrument can be situated at a distance of 1 km and more from the data unit.

TITLE: Scientific-Technical Conference on Methods of Radioactive Control and Regulation of Manufacturing Processes (Nauchno-tehnicheskaya konferentsiya po radioaktivnym metodam kontrolya i regulirovaniya proizvodstvennykh protsessov)

PERIODICAL: Priborostroyeniye, 1957, Nr 12, pp. 29-29 (USSR)

ABSTRACT: This conference took place from September 4, to September 7, 1957 at Riga. It was arranged by the central administration for the use of atomic energy attached to the Council of Ministers of the USSR in collaboration with the AN and the council of political economy of the Latvian SSR, as well as the central administration of the scientific technological society for radio engineering and electric communications imeni Popov. The participants were scientists and technical engineers from Moscow, Riga, Kiyev, Tallin, Gor'kiy and other cities. More than 30 reports and papers were read and discussed. They dealt with theoretical works (papers) in the field of calculation and construction of apparatus, based upon the use of radioactive isotopes, and with the adaptation of these apparatus in the different branches of the political economy. The first report was written by Professor N.N.Shumilovskiy,

Scientific-Technical Conference on Methods of Radioactive
Control and Regulation of Manufacturing Processes

119-6-14/16

doctor of technical sciences and L.V.Mel'tser, candidate of technical sciences (institute for automation and telemechanics AN USSR); it dealt with the basic trends and tendencies in the development of the automation production control by means of nuclear radiation. Great attention was paid to the reports of the Scientific Research Institute for the Construction of Heat-Energetic Apparatus (NiiTeplopribor), which dealt with the theoretical principles in the design of radioactive apparatus for the measuring of the level and density of liquids. B.I.Verkhovskiy (Physical Institute AN USSR imeni Lebedev) described a method on the increase of exactness in the measuring of the intensity of radioactive radiation. I.M. Taksar and V.A.Yanushkovskiy (Institute for Physics AN Latvian SSR) reported on the consideration which should be given to the statistic of the control signal at the registration of radiation by means of a radioactive relay. The report of V.K.Latyshev, Yu.S.Pliskin, L.K.Tatochenko and A.K. Felinger (Central Scientific Research Institute for Iron-Mining) dealt with the characterization of the principle of the establishment of a quick-working radioactive ammeter. Other interesting reports were submitted: by the Central Scientific Research Institute for Iron Mining, by the Central

Card 2/3

Scientific-Technical Conference on Methods of Radioactive
Control and Regulation of Manufacturing Processes

119-6-14/16

Laboratory of Automation, by the ALLunion Scientific Research Institute for the Oil Industry and other organizations. The report of the central administration for the use of atomic energy attached to the Council of Ministers of the USSR dealt with the organization of laboratories which are occupied with the use of radiation resources. In a resolution of the conference it was pointed out among other items that the development of the theoretical test work should be considered important, as it makes possible the solution of technical problems in the design of concrete apparatus. The use of typical electron blocks is recommended in the construction of apparatus and the increase of production of new blocks is encouraged. Furthermore, the resolution of the conference proposes to unify and typify the existing apparatus and those in project, above all the apparatus for the measuring of the thickness of sheets, as well as the levels of different milieus. Finally, the wish was expressed to create a special institute for the use of isotopes. These problems should be investigated by the central administration for the use of atomic energy and the AN USSR.

Editorial Board of Sets: V.I. Rimshin, Academician (Resp. Ed.), K.M. Smalovskiy (Deputy Resp. Ed.), V.S. Zaslavskiy (Deputy Resp. Ed.), L.K. Falochko, B.I. Vecherovskiy, S.T. Nazarov, L.I. Petukhov and N.O. Zolotarevskaya (Secretary).

Ed. of Publishing House: P.M. Belyanin; Tech. Ed.: T.P. Polevaya. PURPOSE: This book is intended for specialists in the field of machine and instrument manufacture who use radioactive isotopes in the study of materials and processes.

COVERAGE: This collection of papers covers a very wide field of the utilization of tracer methods in industrial research and control techniques. The topic of this volume is the use of radioisotopes in the machine- and instrument-manufacturing industry. The individual papers discuss the applications of radioisotope techniques in the study of metals and alloys, problems of friction and lubrication, metal cutting, engine performance, and defects in metals. Several papers are devoted to the use of radioisotopes in the automation of industry, flow measurement, recording devices, quality control, control of processes, and the use of radioisotopes in various Soviet institutes and laboratories. They were published at the Transactions of the All-Union Conference on the Use of Radioactive and Stable Isotopes and Radiation in the National Economy and Science, April 4-12, 1957. No personalities are mentioned. References are given at the end of most of the papers.

TITLE: The Main Problems of Designing Self-Compensating Radioactive Densimeters for Liquids (Osnovnyye voprosy proyektirovaniya avtokompensatsionnykh radioaktivnykh plotnomerov zhidkosti)

PERIODICAL: Priborostroyeniye, 1958, Nr 5, pp. 22-24 (USSR)

ABSTRACT: Measuring of density can be carried out in two different ways:
a) The decrease of the intensity of a β -source which has fully irradiated the liquid, is measured and from this the density is computed.
b) The decrease of intensity of a β -ray scattered on the liquid to be measured, is measured. The decrease shows the degree of density.

The first method is dealt with in detail theoretically and two Soviet devices PZhR-3, PZhR -2 are described which work according to this principle. The principle of self-compensation consists in the fact that two bundles of rays pass simultaneously through the liquid and the compensation element. They are divided by two measuring devices connected in difference switching. The

Card 1/2

The Main Problems of Designing Self-Compensating
Radioactive Densimeters for Liquids

119-58-5-7/11

signal, which causes balancing, acts upon the compensation element until the amount of the balancing signal does not become smaller than the threshold value of the sensitivity of the measuring device.

In the device PZhR-3 an integral-ionization chamber is used, because it is of great efficiency, has small statistical fluctuation, and its life is unlimited. There are 3 figures and 5 references, 4 of which are Soviet.

TITLE: Problems of the theory and basis of design of auto-compensated radioactive liquid densitometers

PERIODICAL: Referativnyy zhurnal, Avtomatika i radioelektronika, no. 12, 1961, 27, abstract 12A191 (Radioakt. metody kontrolya i regul. proizvodstva protsessov, Riga, AN Latv. SSR, 1959, 55-63)

TEXT: Described is a method based on determining the variation of intensity of primary beam of γ -rays after its passage through the substance being measured. The radioactive source and the radiation receiver are so arranged that the primary γ -ray beam, after passing through the substance under measurement, enters the radiation receiver. Analyzed are measuring circuits of the autocompensated liquid densitometer, in which there takes place an automatic compensation of the variations of the γ -ray beam intensity resulting from the change of liquid density at all points of the instrument scale.

D209/D303

The application of metallic (steel or aluminum) wedges is proposed as a compensating element for the γ -rays which permits use of a linear scale for the instrument. Basic equations are given, connecting the characteristics of the radiation source with the instrument parameters, object of measurement and controlled process. 5 references. /- Abstractor's note: Complete translation. /

TITLE: Safety Technique in the Extensive Introduction of Radioactive
Apparatus (O tekhnike bezopasnosti pri shirokom vnedrenii
radioaktivnykh priborov)

PERIODICAL: Priborostroyeniye, 1959, Nr 3, pp 21-22 (USSR)

ABSTRACT: The directives of the XX Congress of the KPSU contained the
following passage: Plans must be established in due time
for a more extensive use of radioactive radiation in in-
dustries, agriculture, and medicine, in particular for the
quality control of materials, for the inspection of production
processes and their automatic control. In recent times such
apparatus have been developed and introduced into industries.
The radioactive level gage UR-4 is widely used in the control
of the level of liquid chlorine in containers in various
production processes. The radioactive level indicator RIU-1
measures the maximum and minimum height of dust in dust
eliminators used in roasting pyrites in the "rimming zone".
The radioactive device PZhR intended for the measurement of
the density of fluids is used in the production of chlorinated

Card 1/4

307/110-59-3-8/15

Safety Technique in the Extensive Introduction of Radioactive Apparatus

oil, electrolytic soda, calcium chloride, etc. Special care must be taken in the use of radioactive apparatus which operates with gamma-radiation, and the same holds for apparatus using high-energy β -radiation. 250 of the 500 large industrial plants in the USA use radioactive isotopes in one or another form. In 1957 the use of radioactive isotopes saved 406 million dollars, and this figure will climb to 5 billion dollars in about 5 years. At present all directions for use of radioactive apparatus include specifications as to their installation and operation. If these specifications are strictly complied with, an irradiation of personnel with prohibitively high doses (that is 0.05 roentgen per working day) is excluded. In practice, however, it appeared that the unclear wording of these specifications renders control and sanitary inspection more difficult. Hence it is necessary to issue specialized sanitary regulations for the application of radioactive apparatus with inherent gamma-sources for technological inspection purposes. According to the opinion of the authors these regulations should be based upon the following considerations: In places where people are working who are not professionally engaged in work with ionizing

Card 2/4

SOV/119-59-3-8/15

Safety Technique in the Extensive Introduction of Radioactive Apparatus

radiation, the radiation dose originating from technological inspection apparatus should not exceed one tenth of the maximum admissible radiation dose. If this requirement is to be satisfied in practice, it is necessary to keep the dose rate on the surface of such apparatus below 0.2 microcentgen/second. The majority of apparatus which is in use at present do not comply with this standard, and if such "sub-standard" equipment is employed, additional protective measures are required. Subsequently, formulas for safety clearances are derived and applied to special cases. The safety clearances can also be determined with a dosimeter. It appears to be expedient that the manufacturers of radioactive apparatus should send a team of specialists to customers who will look after the installation of the equipment in a suitable place. A report is given on the problems involved in transporting such equipment and on its regular inspection. Finally, the authors express their gratitude to L. N. Balanina, researcher at the Institut gigiyeny truda i profzabolevaniy (Institute of Labor Hygiene and Professional Diseases) for her valuable assistance.

SOV/25-59-9-5/49

AUTHOR: Furman, K.S. Senior Scientific Worker

TITLE: Atomic Devices for Automation

PERIODICAL: Nauka i zhizn', 1959, ²⁶Nr 9, p 12 - 16 and p 1 of centerfold (USSR)

ABSTRACT: The author reports on the development and introduction of atomic devices. Presently, in the Soviet Union, several thousand such devices are being used. The application of radioactive isotopes in industry, chiefly in technological control devices, saved the national economy about 1.2 to 1.5 billion rubles in 1957. According to data of the Institut ekonomiki Akademii nauk SSSR (Institute of Economics of the AS USSR), in the next 5-6 years the economic effectiveness of the application of radioactive means of automation and control of production processes will increase more than 8 times (for an annual saving of 500 million rubles in 1958 to 4 billion rubles). Any installation for automatic control using nuclear radiation consists

Card 1/4

. Atomic Devices for Automation

SOV/25-59-9-5/49

of 4 elements: radiation source, radiation receiver, electronic block and secondary device. The first two elements are the transmitter of the device. It produces electrical signals depending upon the magnitude of the controlled parameter. In the electronic block, the signals of the transmitting element are produced in such a form that they put into operation the secondary device, with the aid of which the automatic control or the regulation by the process is performed. The selection of isotopes is limited above all by their half-life. The isotopes cobalt-60 and cesium-137 (gamma-emitter), strontium-90 and thallium-204 (beta-emitter) and polonium-210 (alpha-emitter) are mostly used. Radioactive devices are successfully used for checking the density of various liquids used in chemical processes related to the synthesis of new materials in the metallurgical, petroleum, food and other industries. An improved method for measuring gas consumption has been developed based on the following principle: the pipe system through which the gas is supplied, is radiated by a beam of beta-particles. The radiation

Card 2/4

. Atomic Devices for Automation

SOV/25-59-9-5/49

flux is periodically interrupted by a rotating obturator. The beta-rays passing through the wall of the pipe system get into the gaseous medium and form a "little cloud" of ionized gas molecules. Each cloud, passing by the electrodes mounted in the pipe system, induces a charge in them. The moment of charge is fixed by the device and shows the average time needed for the transmission of the cloud from its place formation to the place of registration. This time is also a measure of the velocity of the gas through the pipe system and consequently of the gas consumption. A radioactive density measuring device (Figure 1), a radioactive ionizing manometer (Figure 2), a radioactive consumption measuring device RGT-2 (Figure 3) and a drawing of the automation of a technological process for concentrating various mineral raw materials

Card 3/4

SOV/5486

PURPOSE: The book is intended for technical personnel concerned with problems of application of radioactive isotopes and nuclear radiation in all branches of the Soviet economy.

COVERAGE: An All-Union Conference on problems in the introduction of radioactive isotopes and nuclear radiation into the national economy of the Soviet Union took place in Riga on 12-16 April 1960. The Conference was sponsored by: the Gosudarstvennyy nauchno-tekhnicheskii komitet Soveta Ministrov SSSR (State Scientific and Technical Committee of the Council of Ministers, USSR); Glavnoye upravleniye po ispol'zovaniyu atomnoy energii pri Sovete Ministrov SSSR (Main Administration for the Utilization of Atomic Energy of the Council of Ministers, USSR); Academy of Sciences, USSR; Gosplan USSR; Gosudarstvennyy komitet Soveta Ministrov SSSR po avtomatizatsii i mashinostroyeniyu (State Committee of the Council of Ministers, USSR, for Automation and Machine Building) and the Council of Ministers of the Latvian SSR. The transactions of this Conference are published in four volumes. Volume I contains articles on the following subjects: the general problems of the Conference topics; the state and prospects of development of radiation chemistry; and results and prospects of applying radioactive isotopes and nuclear radiation in the petroleum refining and chemical industries. Problems of designing and manufacturing instruments which contain sources of radioactive radiation and are used for checking and automation of technological processes are examined, along with problems of accident prevention in their use. No personalities are mentioned. References accompany some of the articles.

AUTHORS: Veksler, M. A., Furman, K. S., Mukhin, G. A.

TITLE: Prospects for the adoption of radioactive fluid density meters in the organic synthesis industry (experience of testing and introduction)

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 4, 1962, 314, abstract 4I206 (Sb. "Radioakt. izotopy i yadern. izlucheniya v nar. kh-ve SSSR. v. 1". M., Gostoptekhizdat, 1961, 257 - 262)

TEXT: The results are given of long duration tests on radioactive fluid density meters with halogen counters (ПХР-1 (PZhR-1)), scintillation counters (ПХР-2 (PZhR-2)) and differential high pressure ionization chambers (ПХР-5 (PZhR-5)). The instruments were tested in aqueous solutions of calcium and zinc chlorides, and also in carbon tetrachloride. The tests made it possible to establish the effect of the composition of a liquid on instrument readings and the reproducibility of readings at different points on the scale. Design shortcomings were shown up and the basic error assessed. [Abstracter's note: Complete translation.]

Title : Magnetic Mass Spectrometer.

Orig Pub : Repts. "J. Stefan" Inst., 1957, 4, 109-115

Abstract : Description of a magnetic mass spectrometer, intended for isotopic analysis of substances, introduced into the ion source in the form of the gas. The ions are formed in the source by electron bombardment. Electron current up to 300 microamperes. The ions are separated by their m/e ratio in a homogeneous sector (120°) magnetic field; the radius of curvature of the trajectory of the ions is 150 mm. The mass spectrum can be scanned by changing both the magnetic field and the ion energy. In the latter case rapid scanning is possible and up to 100 lines can be
